

Evaluation: Introduction and Heuristics

Human Computer Interaction

Alberto Monge Roffarello

Academic Year 2023/2024

The Four Pillars of Design

Ben Shneiderman & Catherine Plaisant, Designing the User Interface: Strategies for Effective Human-Computer Interaction

Goals

Generating design solutions

- Guidelines
- Principles
- Theories
- Design Patterns

Evaluating generated designs

- Expert reviews and heuristics
- Usability testing
- Controlled experiments

Evaluation

Testing the usability, functionality and acceptability of an interactive system

Goal

- Evaluation: «Evaluation tests the usability, functionality and acceptability of an interactive system»
 - According to the design stage (sketch, prototype, final)
 - According to the initial goals
 - Alongside the different usability dimensions
 - Using a range of different techniques
- Identify and correct issues as soon as possible

Usability

- **Usability:** how well users can use the system's functionality.
- Dimensions of usability:
 - **Usefulness:** does it do something people want?
 - **Learnability:** is it easy to learn?
 - **Memorability:** one learned, is it easy to remember?
 - **Effectiveness:** does it allow reaching the goal?
 - **Efficiency:** once learned, is it fast to use?
 - **Visibility:** is the state of the system visible?
 - **Errors:** are errors few and recoverable?
 - **Satisfaction:** is it enjoyable to use?

Functionality

- **Functionality:** the system's functionality must accord with the user's requirements and should enable users to perform their intended tasks.
- Functionality can be tested in different ways:
 - Are the appropriate functionality available within the system?
 - Are they clearly reachable by the user?
 - Do they match the user's expectations?
- Functionality evaluation may also include measuring the user's performance with the system, to assess the effectiveness of the system in supporting the task.

Acceptability

- Technology **acceptability** is one's perception of a system before use, while technology **acceptance** is one's perception of the system after use.
- Good User Interface Design can make a product easy to understand and use, which results in greater user acceptance.
- Testing **acceptability** means evaluating the enjoyment and emotional response to a system, particularly in the case of systems that are aimed at leisure or entertainment.
- This may involve:
 - measuring satisfaction and comfort
 - identifying areas of the design that overload the user

Many Evaluation Approaches

- Evaluation may take place:
 - In the laboratory
 - In the field

Many Evaluation Approaches

- In lab studies, users are taken out of their normal work environment to take part in **controlled** tests. They are typically adopted in the early stages of design (e.g., to compare alternatives, you don't need a working implementation).
 - 👍 simulation of dangerous environments
 - 👍 suitable for specific tasks within a system
 - 👎 lack of context
 - 👎 unnatural situations leading to biases
 - 👎 not suitable for all the tasks

Many Evaluation Approaches

- Field studies takes the designer or evaluator out into the **user's work environment** in order to observe the system in action.

-  open nature: the “real” context
-  users are in their natural environment
-  low degree of control
-  higher costs (you need a working implementation)
-  longer duration

Many Evaluation Approaches

- Evaluation may be based on **expert evaluation**:
 - Analytic methods
 - Review methods
 - Model-based methods
 - Heuristics
- It is useful to identify any areas that are likely to cause difficulties because they violate known cognitive principles, or ignore accepted empirical results
 - 👍 it can be used at any stage in the development process
 - 👍 it is relatively cheap, since it does not require user involvement
 - 👎 it does not assess actual use of the system

Many Evaluation Approaches

- Evaluation may involve users:
 - Experimental methods
 - Observational methods
 - Query methods
 - Formal or semi-formal or informal
- In experimental and observational methods, the evaluator chooses a hypothesis to test, which can be determined by measuring some attribute of participant behavior.
 - 👍 they provide empirical evidence
 - 👎 they require more time to be designed and analyzed
- Query techniques (e.g., interviews) relies on asking the user about the interface directly
 - 👍 they are simple and cheap
 - 👎 you get subjective results

Many Evaluation Approaches

- We can also adopt automated evaluation:
 - Simulation and software measures
 - Formal evaluation with models and formulas
 - Especially for low-level issues

Heuristic Evaluation

Experts check potential issues on your design, by referring to a set of heuristic criteria

When Is Design Critique Useful?

- Before user testing
 - To save effort
 - Solving easy-to-solve problems
 - Leaving user testing for bigger issues
- Before redesigning
 - Identify the good parts (to be kept) and the bad ones (to be redesigned)
- To generate evidence for problems that are known (or suspected)
 - From ‘murmurs’ or ‘impressions’ to hard evidence
- Before release
 - Smoothing and polishing

Heuristic Evaluation

- A method developed by Jacob Nielsen (1994)
 - Structured design critique
 - Using a set of simple and general heuristics
 - Executed by a small group of experts (3-5)
 - Suitable for any stage of the design (sketches, UI, ...)
 - Goal: find usability problems in a design
- Also popularized as “Discount Usability”
- A heuristic is a guideline or general principle or rule of thumb that can guide a design decision or be used to critique a decision that has already been made.

<https://www.nngroup.com/articles/how-to-conduct-a-heuristic-evaluation/>

Basic Idea

- Define a set of heuristics (or principles)
- Give those heuristics to a group of experts
 - Each expert will use heuristics to look for problems in the design
- Experts work independently
 - Each expert will find different problems
- At the end, experts communicate and share their findings
 - Findings are analyzed, aggregated, ranked
- The discovered violations of the heuristics are used to fix problems or to re-design

The screenshot shows the NN/g Nielsen Norman Group website. The header includes the logo, navigation links (Home, Articles, Training & Events, Consulting, Reports & Books, About NN/g), and a search bar. The main content area features the article 'How to Conduct a Heuristic Evaluation' by Jakob Nielsen. The article summary states: 'Heuristic evaluation involves having a small set of evaluators examine the interface and judge its compliance with recognized usability principles (the "heuristics").' Below the summary is a detailed explanation of heuristic evaluation, mentioning its history, benefits, and how it can be improved through multiple evaluations. A diagram titled 'Heuristic Evaluation Results Grid' is shown, illustrating the overlap of problems found by different evaluators. The footer contains a sidebar with recent articles and popular articles.

Heuristics

- Nielsen proposed 10 heuristic rules
 - Good at finding most design problems
 - Inspired and connected to the Design Principles (→Guidelines)
- In a specific context, application domain, or for specific design goals ...
 - ... new heuristics can be defined
 - ... some heuristic can be ignored

Phases of Heuristic Evaluation

1. Pre-evaluation training
 - Give evaluator information about the domain and the scenario to be evaluated
2. Evaluation
 - Individual
3. Severity Rating
 - First, individually
 - Then, aggregate and find consensus
4. Debriefing
 - Review with the design team

Evaluation (I)

- Define a set of tasks, that the evaluators should analyze
- For each task, the evaluator should step through the design several times, and inspect the UI elements
 - On the real design, or on a preliminary prototype
- At each step, check the design according to each of the heuristics
 - 1st step, get a general feeling for the interaction flow and general scope
 - 2nd step (and following), focus on specific UI elements, knowing where they fit in the general picture
- Heuristics are used as a “reminder” of things to look for
 - Other types of problems can also be reported

Evaluation (II)

- Comments from each evaluator should be recorded or written
 - There may be an observer, taking notes
 - The observer may provide clarifications, especially if the evaluator is not a domain expert
- Session duration is normally 1h – 2h
- Each evaluator should provide a list of usability problems
 - Which heuristic (or other usability rule) has been violated, and why
 - Not a subjective comment, but a reference to a known principle
 - Each problem reported separately, in detail

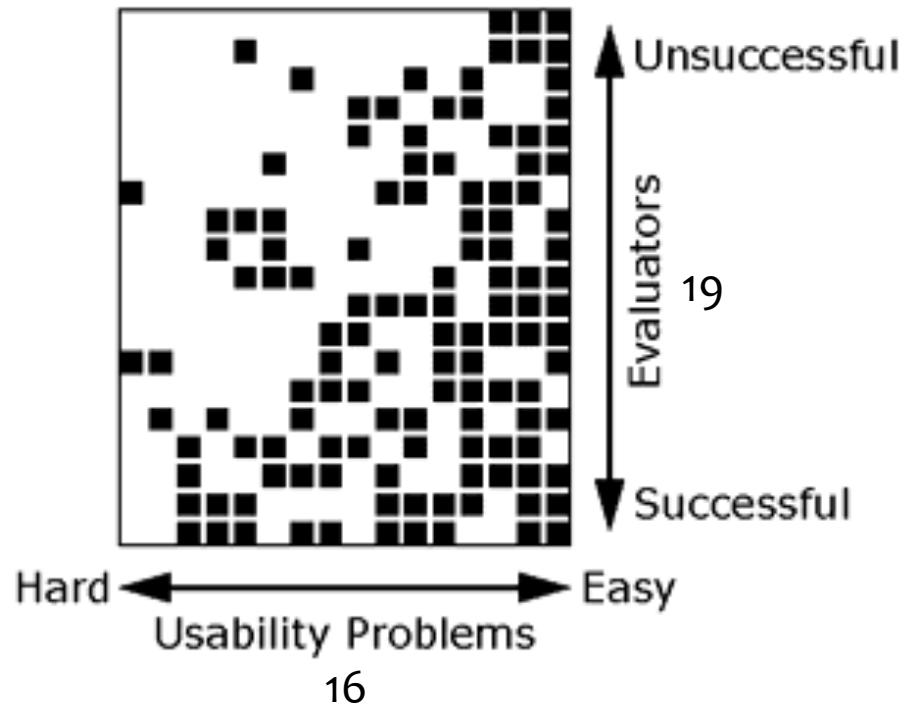

<https://www.nngroup.com/articles/usability-problems-found-by-heuristic-evaluation/>

Evaluation (III)

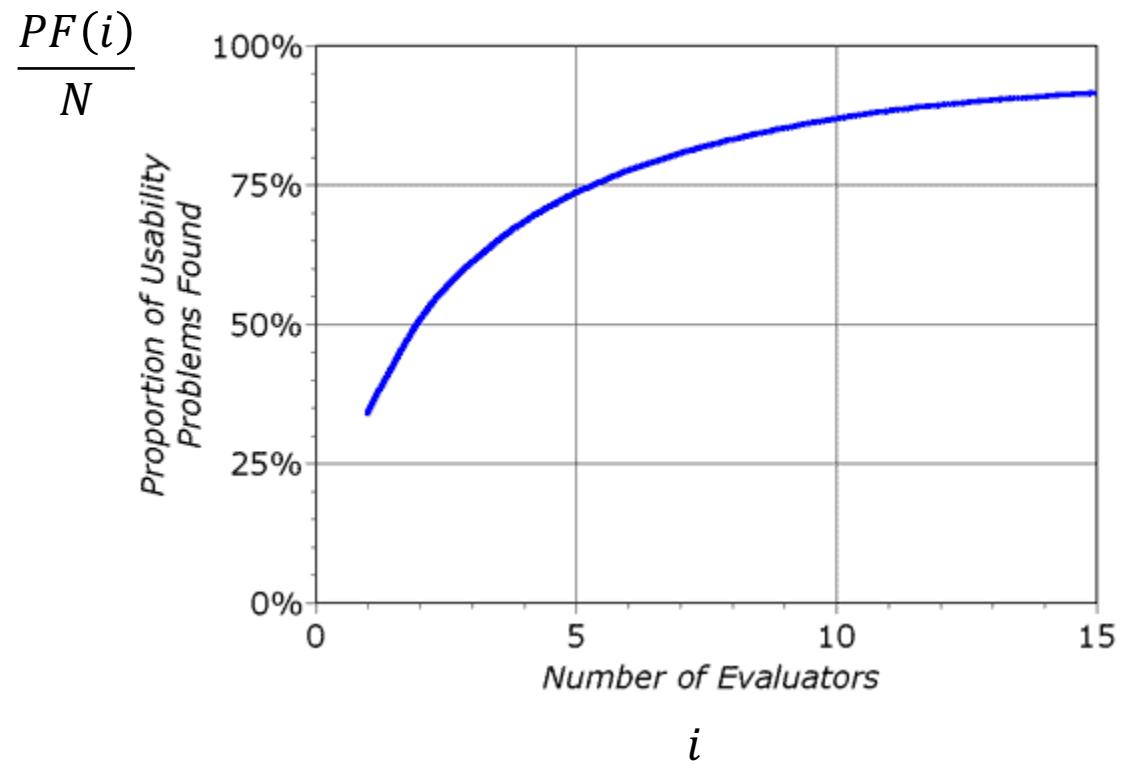

- Where problems may be found
 - A single location in the UI
 - Two or more locations that need to be compared
 - Problem with the overall UI structure
 - Something is missing
 - May be due to prototype approximation
 - May still be unimplemented

Multiple Evaluators

- No evaluator finds all problems
 - Even the best one finds only ~1/3
- Different evaluators find different problems
 - Substantial amount of nonoverlap
- Some evaluators find more problems than others

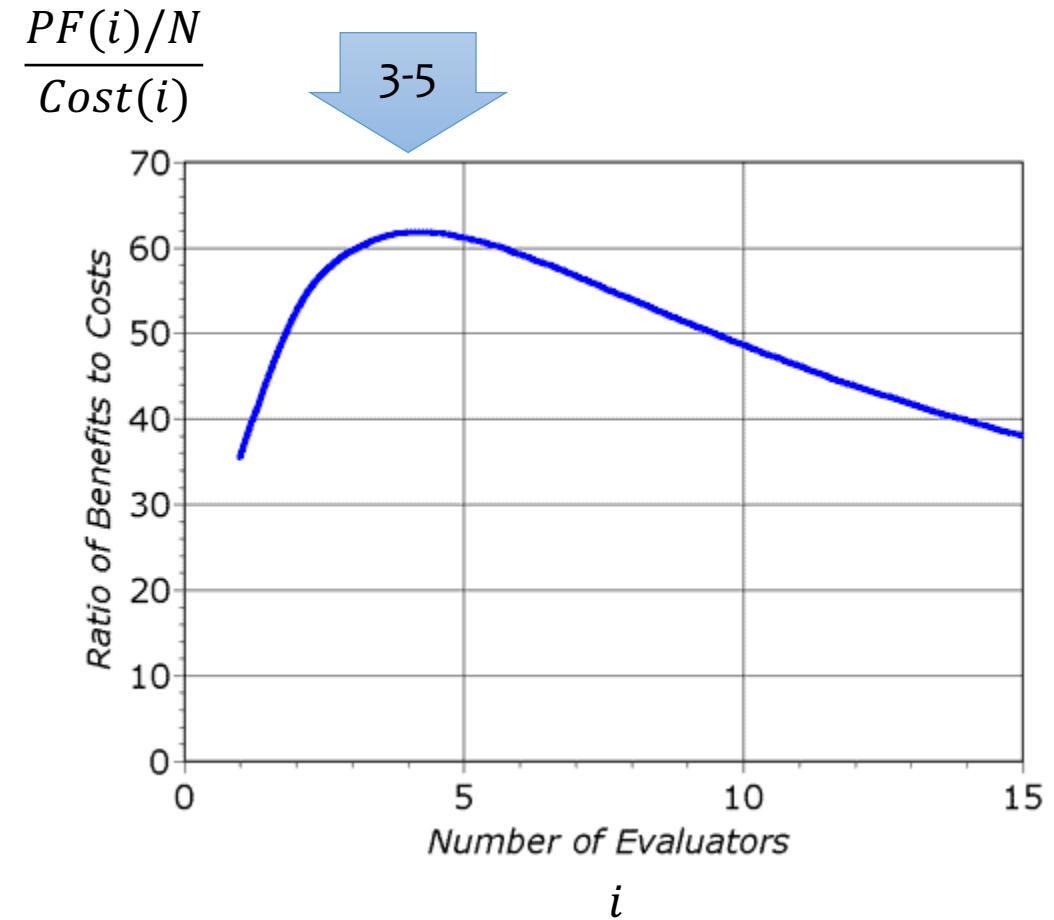

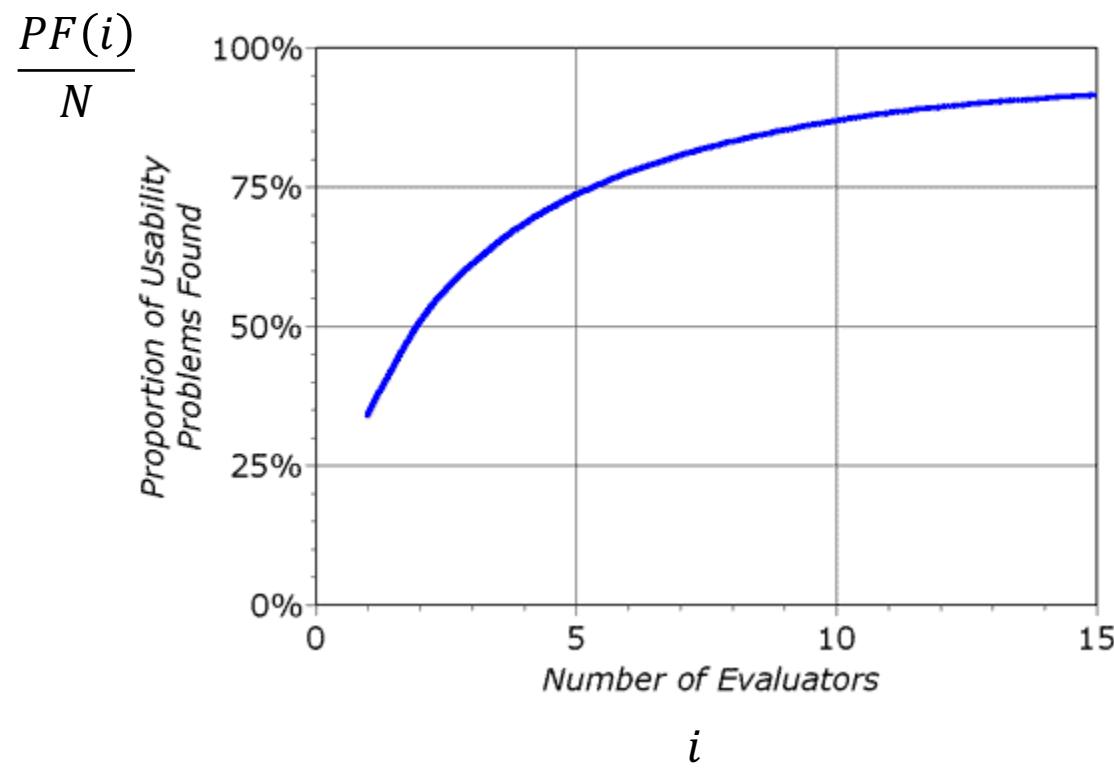

How Many Evaluators?

- $PF(i) = N(1 - (1 - l)^i)$
- $PF(i)$: problems found
- i : number of *independent* evaluators
- N : number of existing (but unknown) usability problems
- l : ratio of usability problems found by a single evaluator

How Many Evaluators?

$$Cost(i) = \text{Fixed} + \text{Fee} \times i$$

<https://www.nngroup.com/articles/how-to-rate-the-severity-of-usability-problems/>

Severity Rating

- We need to allocate the most resources to fix the most serious problems
- We need to understand if additional usability efforts are required
- **Severity** is a combination of:
 - **Frequency** with which the problem occurs: common or rare?
 - **Impact** of the problem if it occurs: easy to overcome or difficult?
 - **Persistence**, is it one-time or will it occur many times to users?
- Define a *combined severity rating*
 - Individually, for each evaluator

- UX Mapping Methods Compared: A

Finally, a user needs to agree the severity of the problem since certain usability problems can have a devastating effect on the popularity of a product, even if they are "objectively" quite easy to overcome. Even though severity has several components, it is common to combine all aspects of severity in a single severity rating as an overall assessment of each usability problem in order to facilitate prioritizing and decision-making.

The following 0 to 4 rating scale can be used to rate the severity of usability problems:

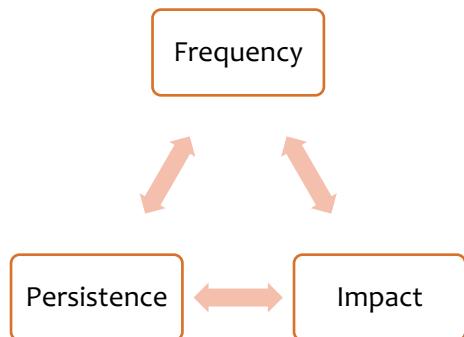

0 = I don't agree that this is a usability problem at all
1 = Cosmetic problem only: need not be fixed unless extra time is available on project
2 = Minor usability problem: fixing this should be given low priority
3 = Major usability problem: important to fix, so should be given high priority
4 = Usability catastrophe: imperative to fix this before product can be released

Severity Ratings in Heuristic Evaluation

It is difficult to get good severity estimates from the evaluators during a *heuristic evaluation* session when they are more focused on finding new usability problems. Also, each evaluator will only find a small number

Severity Ratings scale

0	No problem	I don't agree that this is a usability problem at all
1	Cosmetic problem only	need not be fixed unless extra time is available on project
2	Minor usability problem	fixing this should be given low priority
3	Major usability problem	important to fix, so should be given high priority
4	Usability catastrophe	imperative to fix this before product can be released

Combined Severity Ratings

- Severity ratings from one evaluator have been found *unreliable*, they should not be used
- After all evaluators completed their rankings
 - Either let them discuss, and agree on a consensus ranking
 - Or just compute the average of the 3-5 ratings

Debriefing

- Meeting of all evaluators, with observers, and members of the development team
- Line-by-line analysis of the problems identified
 - Discussion: how can we fix it?
 - Discussion: how much will it cost to fix it?
- Can also be used to brainstorm general design ideas

Heuristic Evaluation vs. User Testing

Heuristic Evaluation

- Faster (1-2h per evaluator)
- Results are pre-interpreted (thanks to the evaluators)
- Could generate *false positives*
- Might miss some problems

User Testing

- Need to develop software, and prepare the set-up
- More accurate (by definition!)
 - Actual users and tasks
- ... more on this later in the course!

Heuristic Evaluation vs. User Testing

Heuristic Evaluation

- Faster (1-2h per evaluator)
- Results are pre-interpreted (thanks to the evaluators)
- Could generate ~~false positives~~
- Might miss some

User Testing

- Need to develop software, and prepare the set-up
- More accurate (by definition!)
 - Actual users and tasks

10 Usability Heuristics for User Interface Design
by Jakob Nielsen on April 24, 1994
Topics: Heuristic Evaluation Human Computer Interaction Web Usability

Summary: Jakob Nielsen's 10 general principles for interaction design. They are called "heuristics" because they are broad rules of thumb and not specific usability guidelines.

#1: Visibility of system status
The system should always keep users informed about what is going on, through appropriate feedback within reasonable time.
(Read full article on [visibility of system status](#) and watch 3 min. [video on the visibility heuristic](#).)

#2: Match between system and the real world
The system should speak the users' language, with words, phrases and concepts familiar to the user, rather than system-oriented terms. Follow real-world conventions, making information appear in a natural and logical order.
(Read full article on [match between the system and the real world](#) and watch 3 min. [video on the real-world heuristic](#).)

#3: User control and freedom
Users often choose system functions by mistake and will need a clearly marked "emergency exit" to leave the unwanted state without having to go through an extended dialogue. Support undo and redo.
(Watch 2-min. [video on the user control heuristic](#).)

#4: Consistency and standards
Users should not have to wonder whether different words, situations, or actions mean the same thing. Follow platform conventions.
(Watch 3-min. [video on consistency & standards](#).)

#5: Error prevention
Even better than good error messages is a careful design which prevents a problem from occurring in the first place. Either eliminate error-prone conditions or check for them and present users with a confirmation option before they commit to the action.

10 Nielsen's Usability Heuristics

- #1: Visibility of system status
- #2: Match between system and the real world
- #3: User control and freedom
- #4: Consistency and standards
- #5: Error prevention
- #6: Recognition rather than recall
- #7: Flexibility and efficiency of use
- #8: Aesthetic and minimalist design
- #9: Help users recognize, diagnose, and recover from errors
- #10: Help and documentation

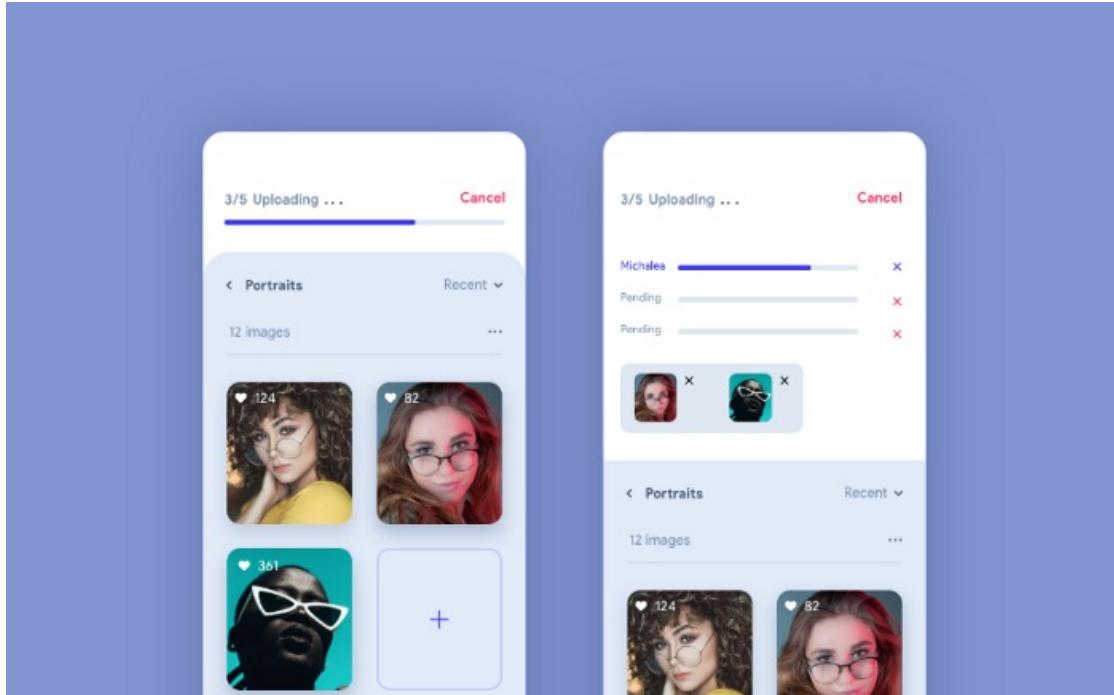

#1: Visibility of system status

- The system should always keep users informed about what is going on, through appropriate feedback within reasonable time.

<https://www.nngroup.com/articles/visibility-system-status/>

#1: Visibility of system status

Type new password: * * * * * * * *
Six-characters minimum; case sensitive

Password strength: Strong

Some examples from: <http://designingwebinterfaces.com/6-tips-for-a-great-flex-ux-part-5>

Which Feedback?

- Time
 - Execution time for tasks
- Space
 - E.g., occupation of cloud storage
- Change
 - Ensure that the user is aware of changes that he requested (e.g., save, delete, send, ...)
- Action
 - What is happening (running, stopped, ...), in a redundant way
- Next steps
 - What will happen because of your action, and your possible next actions at this point
- Completion
 - Clarify when a task has been finalized

Rule of Thumb (Time)

- If the execution time is...
- ... Less than 1 second ⇒ just show the outcome of the action
- ... Around 1-2 seconds ⇒ show feedback that the action is underway
- ... More 2-3 seconds ⇒ show progress (percentage, estimated time, ...)

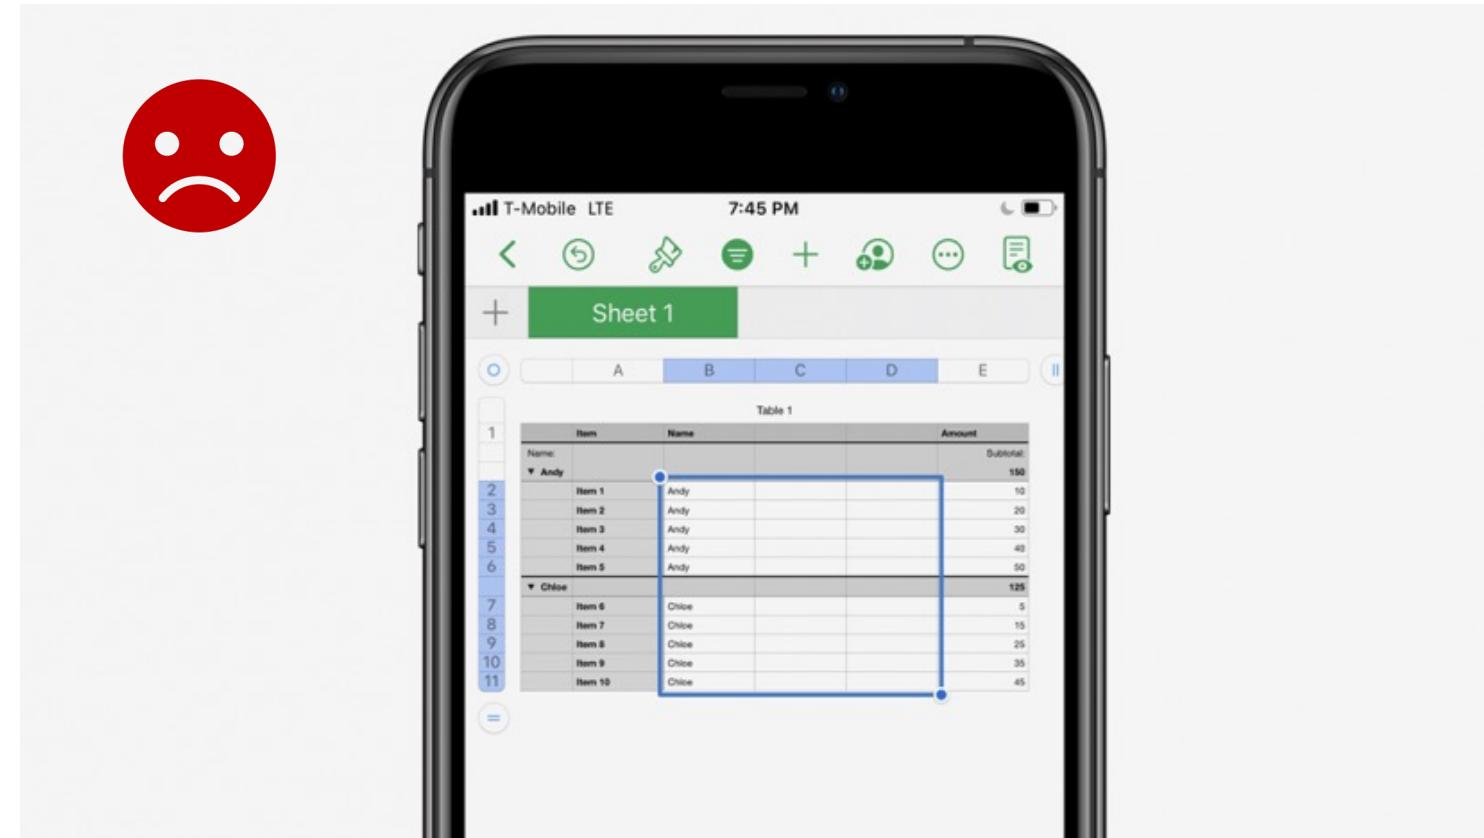

#2: Match between system and the real world

- The system should speak the users' language, with words, phrases and concepts familiar to the user, rather than system-oriented terms. Follow real-world conventions, making information appear in a natural and logical order.
- Use familiar metaphors and language

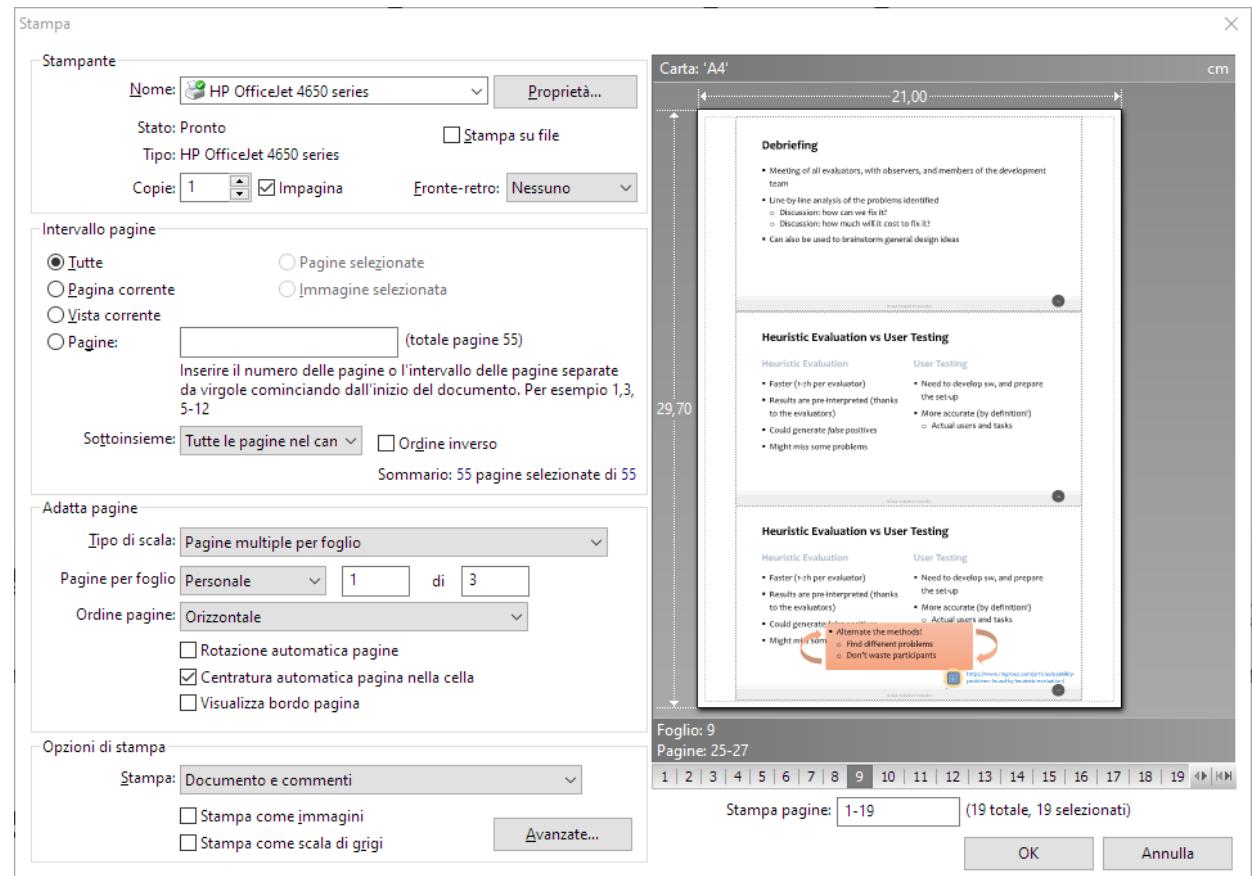

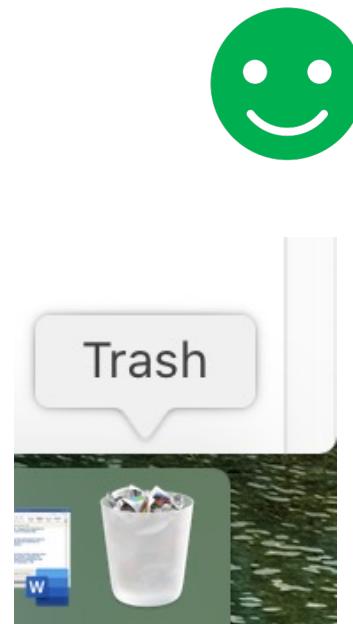

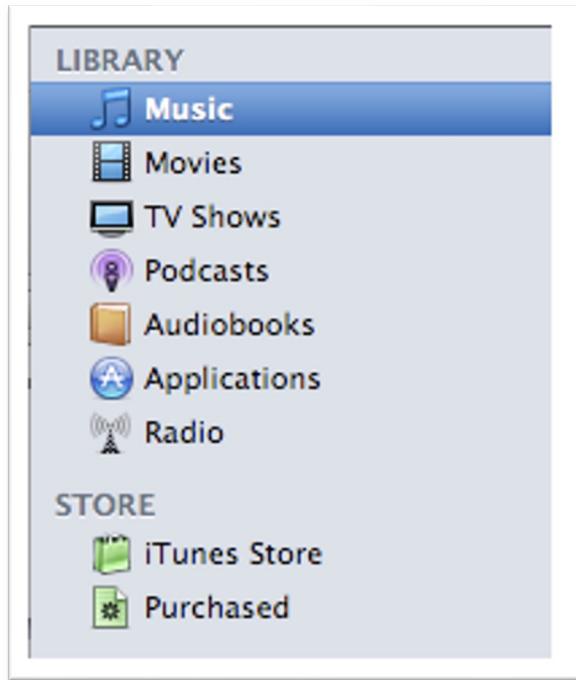

[https://www.nngroup.com/articles/
match-system-real-world/](https://www.nngroup.com/articles/match-system-real-world/)

#2: Match between system and the real world

#2: Match between system and the real world

Exploit Familiarity

- Familiar Metaphors
 - Files, paper, folders, highlighters, ...
- Familiar Language
 - Avoid jargon, acronyms, etc. that could be unknown to your users
- Familiar Categories
- Familiar Choices
 - E.g., explain the meaning of the error message (what happened, what are the consequences, what are the available options) in a simple way

#3: User control and freedom

- Users often choose system functions by mistake and will need a clearly marked "emergency exit" to leave the unwanted state without having to go through an extended dialogue. Support undo and redo.

#3: User control and freedom

#3: User control and freedom

How long have you used our product / service?

Less than a month

1-6 months

1-3 years

Over 3 Years

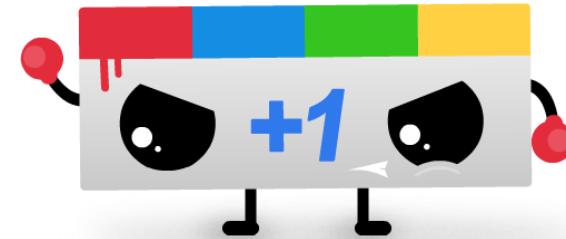

Suggestions

- Always provide a “back” (or equivalent) button
- Allow users to “explore” different alternative paths
 - Except for one-shot wizard-like paths, aimed at novices or first-time users

#4: Consistency and standards

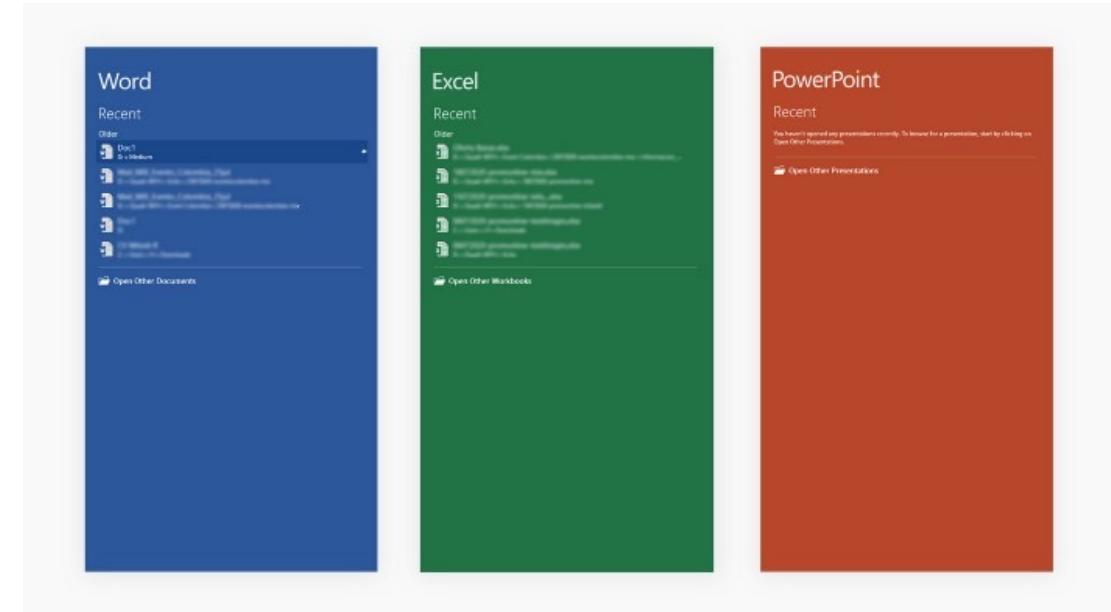

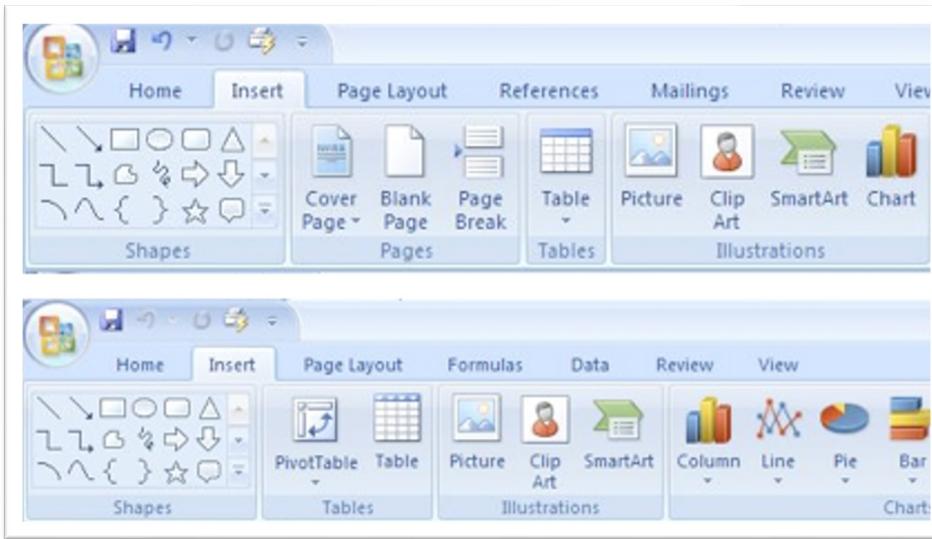

- Users should not have to wonder whether different words, situations, or actions mean the same thing. Follow platform conventions.

#4: Consistency and standards

BrandFlakesforBreakfast's [Illustration](#)

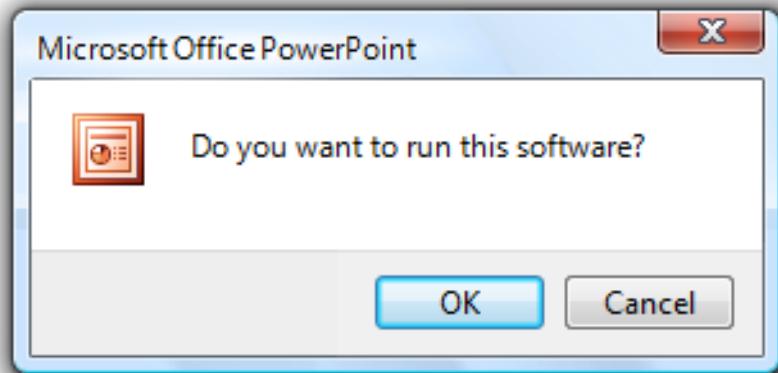

#4: Consistency and standards

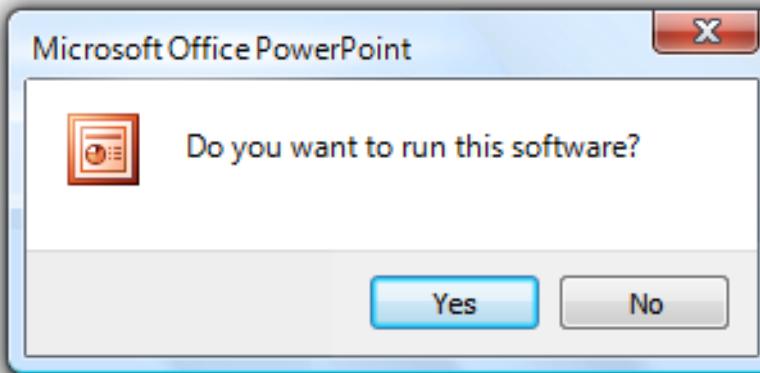

Suggestions

- Consistent layout for dialogs and forms
 - E.g., position of the navigation elements
 - E.g., position of the confirmation buttons
- Consistent meaning for Ok/Cancel, Yes/No choices
 - E.g., avoid: “Do you want to interrupt task?”
 - Still better, label buttons with the actual effect “Insert”, “Interrupt”, ...
- Categories, lists of names, geographical regions, etc, should be taken from “standard” vocabularies

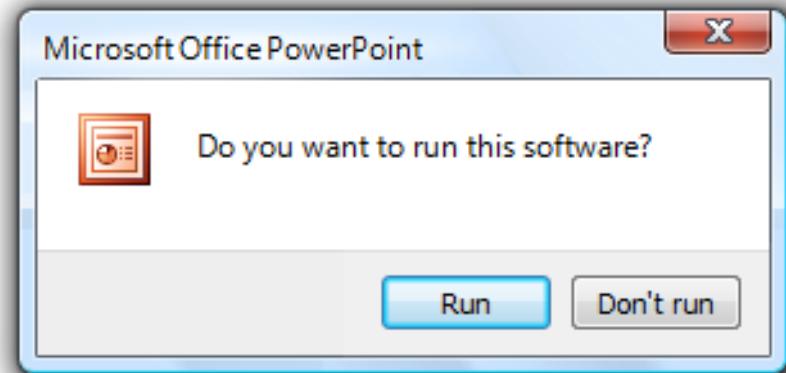

Examples

Bad

Acceptable

Better

source: <https://docs.microsoft.com/en-us/windows/win32/uxguide/win-dialog-box>

#5: Error prevention

- Even better than good error messages is a careful design which prevents a problem from occurring in the first place. Either eliminate error-prone conditions or check for them and present users with a confirmation option before they commit to the action.

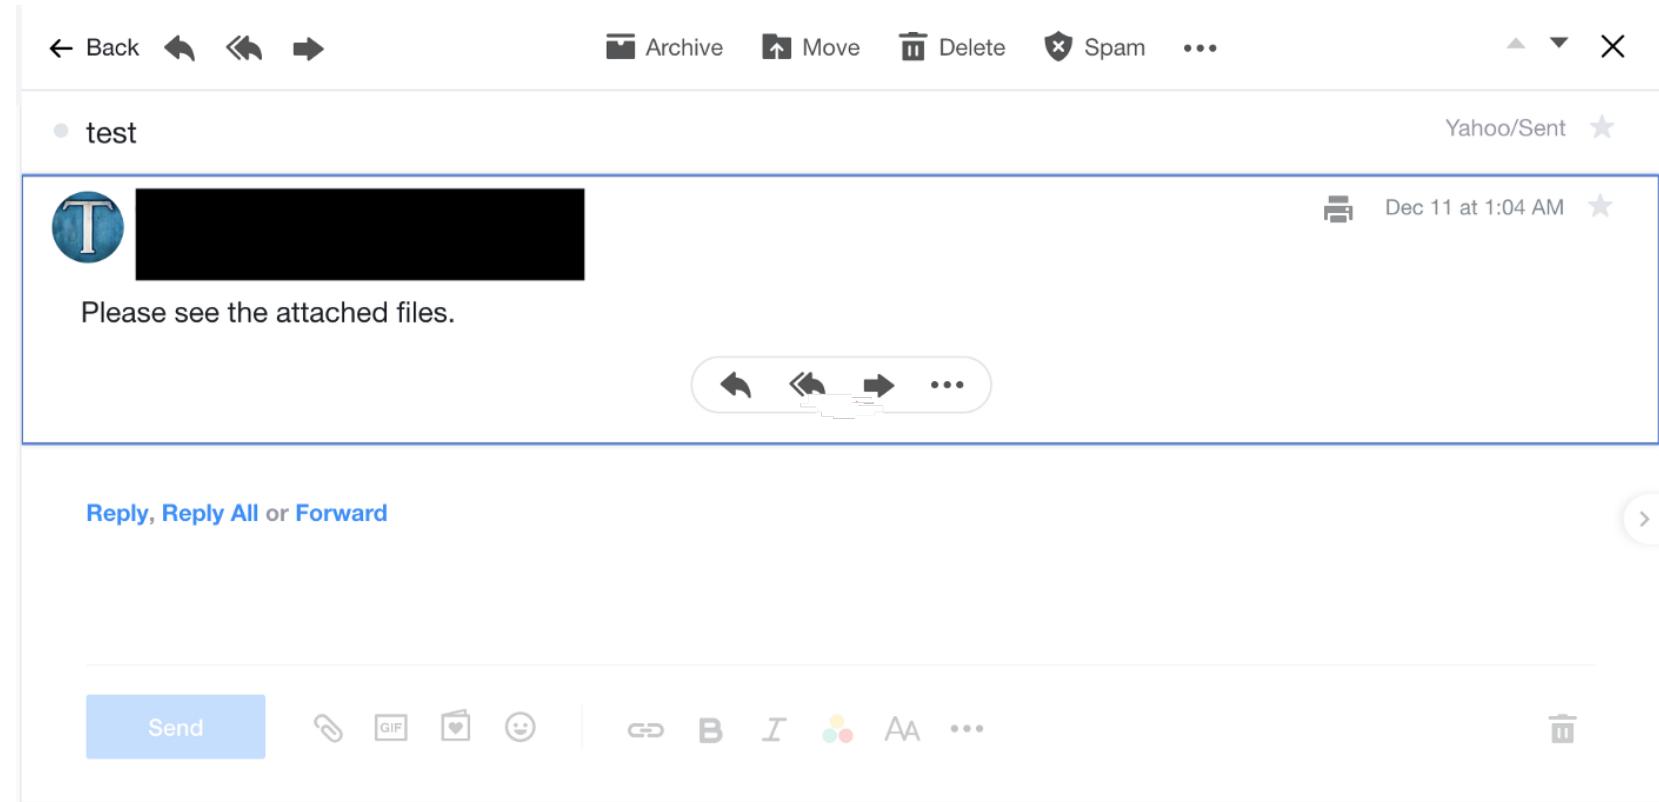

[https://www.nngroup.com/articles/
slips/](https://www.nngroup.com/articles/slips/)

Suggestions

- Preventing data loss
- Prevent clutter
- Prevent confusing flow
- Prevent bad input
- Prevent unnecessary constraints (e.g., provide defaults for missing data)

#5: Error prevention

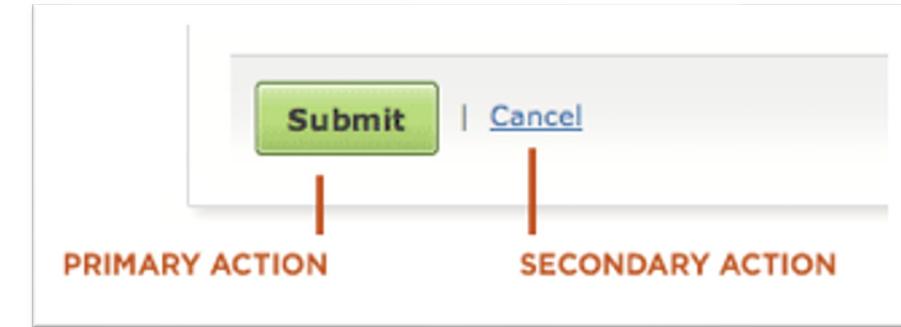

#5: Error prevention

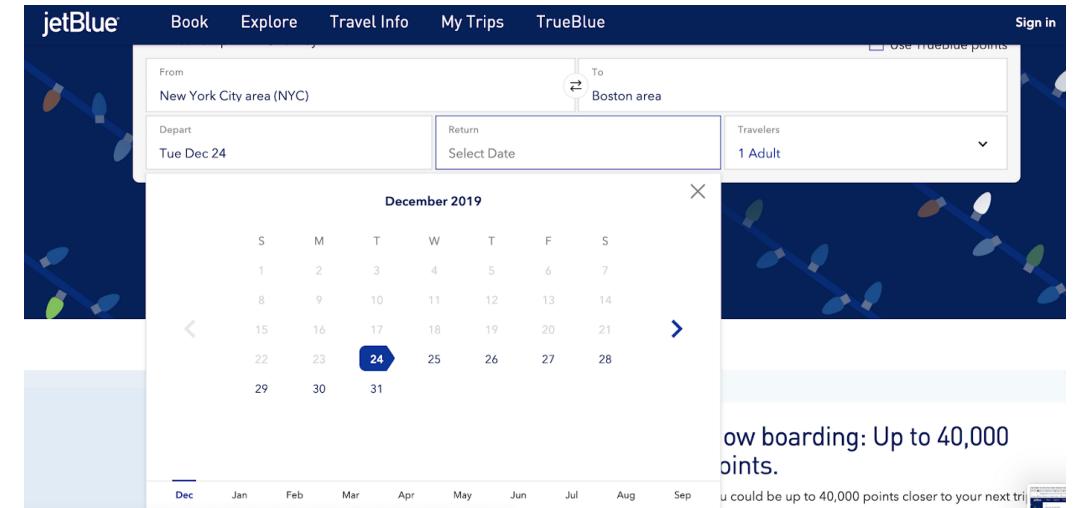

Share something with **Usabilitypost**:

Update

Attach file

#5: Error prevention

#6: Recognition rather than recall

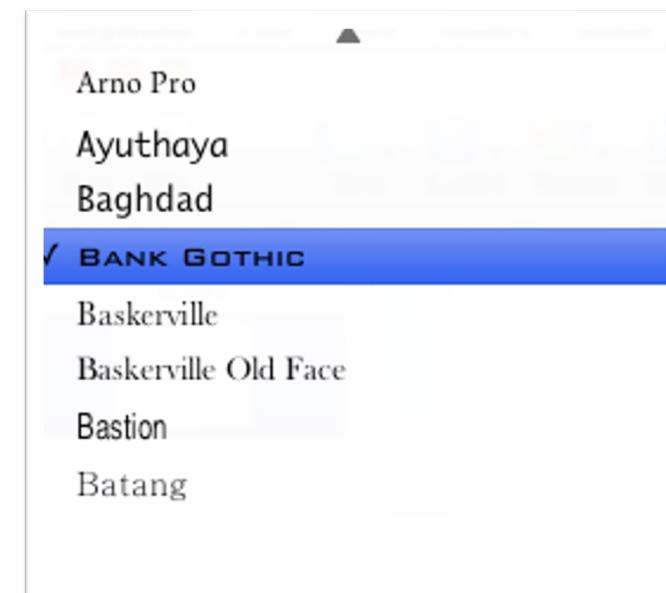

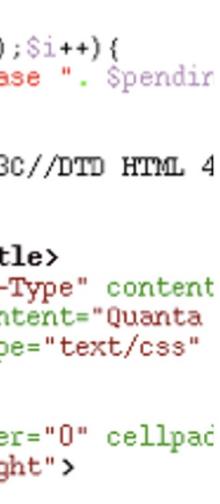

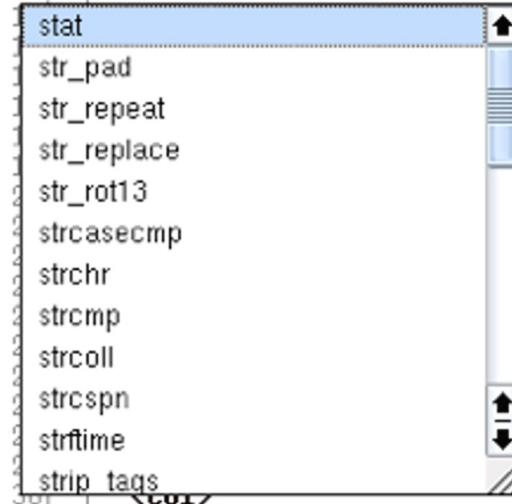

- Minimize the user's memory load by making objects, actions, and options visible. The user should not have to remember information from one part of the interface to another. Instructions for use of the system should be visible or easily retrievable whenever appropriate.

<https://www.nngroup.com/articles/recognition-and-recall/>

#6: Recognition rather than recall

```

str_rot13
strcasecmp
strchr
strcmp
strcoll
strcspn
strftime
strip_tags
```

Example

A screenshot of Visual Studio Code showing a search and replace dialog. The dialog has 'and' selected in the 'Find' field and 'or' selected in the 'Replace' field. A tooltip 'Replace All (Ctrl+Alt+Enter)' is visible over the 'Replace All' button. The code editor shows a document with several occurrences of 'and' and 'or' highlighted in blue. The status bar at the bottom indicates 'Ln 4, Col 54 (3 selected)'. The title bar says 'related-work.tex - Visual Studio Code'.

A screenshot of a terminal window titled 'openSUSE-Leap-15-1'. It displays a command-line session:

```
\section{Related Work}
\label{sec:related-work}

This work lies in the software engineering domain and is intended to provide insights about the suitability of a computational narrative approach to document, execute, and share the steps involved in IoT prototyping, especially for novice programmers.

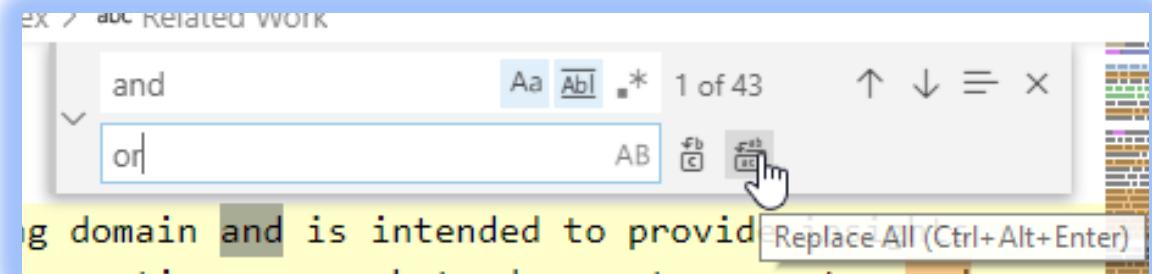

%To the best of our knowledge, \highlight{no other authors}\footnote{it's a strong statement... are we absolutely sure?} have explored this strategy. In the following, we addressed the related work from the perspective of (i) exploring and analyzing the current use of notebooks, and (ii) customizing them to fit into a particular context.

In~\cite{Corino:2019} we propose a first approach to an IoT-tailored literate computing tool in the form of a computational notebook. In this article we presented a use case of a typical IoT system involving several interconnected components and described the implementation of a computational notebook as a tool to support its development. Through the analysis of the use case and the landscape of the current computational notebooks, we determined that besides the features of the current computational notebooks an IoT notebook must enable (i) multiple programming languages in the same notebook; (ii) the capability to execute code in the documents in external devices; (iii) keep some code snippets on background execution; (iv) support the specification and installation of mandatory dependencies; and (v) support the visualization of data coming from the sensing devices or external services and platforms. By implementing a prototypical system of the IoT notebook and by validating it against the use case, we could conclude that special attention should be paid on how to execute the code snippets on external devices, and a more in-depth assessment of the benefits and limitations of a computational narrative in the context of IoT software development and prototyping is needed.

Rule~\textit{et al.}~\cite{Rule:2018} assessed the current use of computational notebooks through quantitative analysis of over 1 million notebooks shared online, qualitative analysis of over 200 academic computational notebooks, and interviews with 15 academic data analysts. These analyses demonstrated a tension between exploration and explanation that comp
:g/\<and\>/s//or/g
```

Suggestions

- Avoid codes (use explicit names)
 - e.g., L, VL, EL, EA, ... ???
- Avoid extra hurdles
 - e.g., asking for unnecessary (or premature) information
- Provide previews
 - Code completion
 - Page preview
 - Order summary
 - Itinerary
 - ...

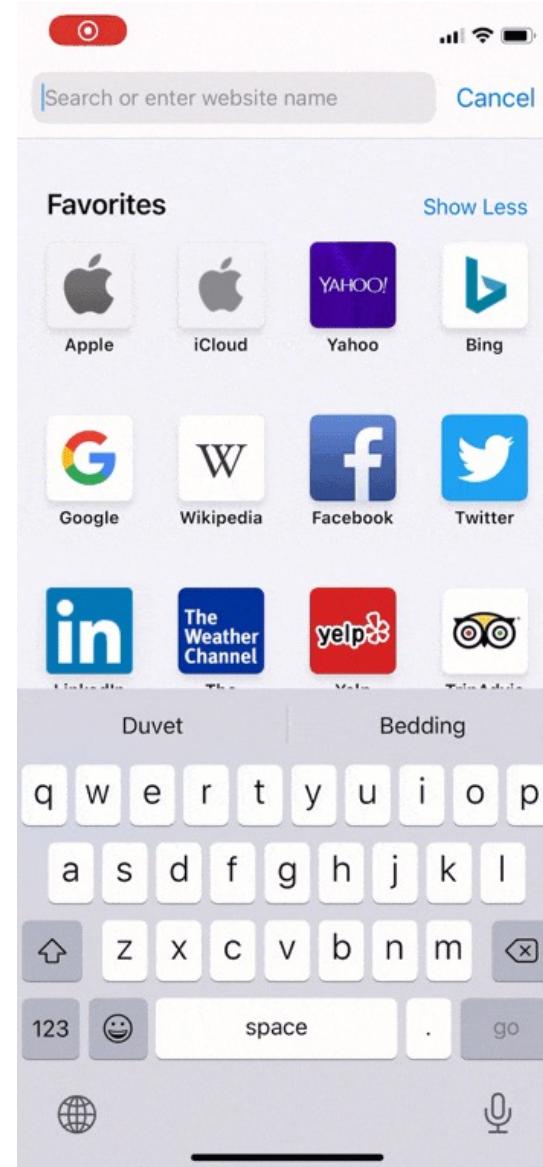

#7: Flexibility and efficiency of use

- Accelerators — unseen by the novice user — may often speed up the interaction for the expert user such that the system can cater to both inexperienced and experienced users. Allow users to tailor frequent actions.

#7: Flexibility and efficiency of use

Common Shortcuts	
Add Action	Return
New Window	⌘N
Synchronize with Server	⌃⌘S
Clean Up	⌘K
Planning Mode	⌘1
Context Mode	⌘2
Inbox	⌃⌘1
Quick Entry	⌃⌃Space
<i>Quick Entry's shortcut can be customized in Preferences</i>	

Suggestions

- Flexibility = Default + Options
 - E.g., present some popular choices, but let the user enter a custom one (train ticket machines)
- Exploit background information for providing more information
 - E.g., weather forecasts in a calendar interface
- Novice and Expert Users Have Different Needs
 - Support proactivity, personalization, and different interaction techniques!
- Recommendations
- Provide relevant information, only

#8: Aesthetic and minimalist design

- Interfaces should not contain information which is irrelevant or rarely needed. Every extra unit of information in an interface competes with the relevant units of information and diminishes their relative visibility.

#8: Aesthetic and minimalist design

rand of Gate Openers and Operators, Elite, Viking, Doorking, Power Master, Ramset, Allstar, FAAC, Apollo, SEA. We are also manufacturer of Custom gates in Aluminum, Iron, Steel our Ornamental gates are second to none. If you're looking for Privacy with your Driveway Gates, Garden Gates, or Walk Thru Gates, we offer a Solid Backing with your choice of Aluminum, Steel, Plexiglas or Plastic. All solid backing are offered in many different colors to choose from. [Privacy Gates](#)

We offer a large selection of Gate Openers and Gate Operators for Residential Driveway Gates, Light or Heavy Commercial Gates, or industrial locations. If you're not sure the style or size of the Gate opener / gate operator you need, please e-mail or contact us so we can gladly help guide you to the correct choice. We offer all types of Gate Openers / Gate Operator, Sliding Gate Openers / Gate Operator, Swing Gate Openers / Gate Operator, Hydraulic Gate Openers / Gate Operator. We also have a wide selection of replacement [Main Circuit Boards](#) for all brands, and [Remote Controls](#) for Visors or Keychains.

[Railings](#) - L. A. Ornamental Rack Corp offers top quality Balcony Railings, Front Porch Railings, Deck Railings in Metal, Aluminum, or Wrought

#8: Aesthetic and minimalist design

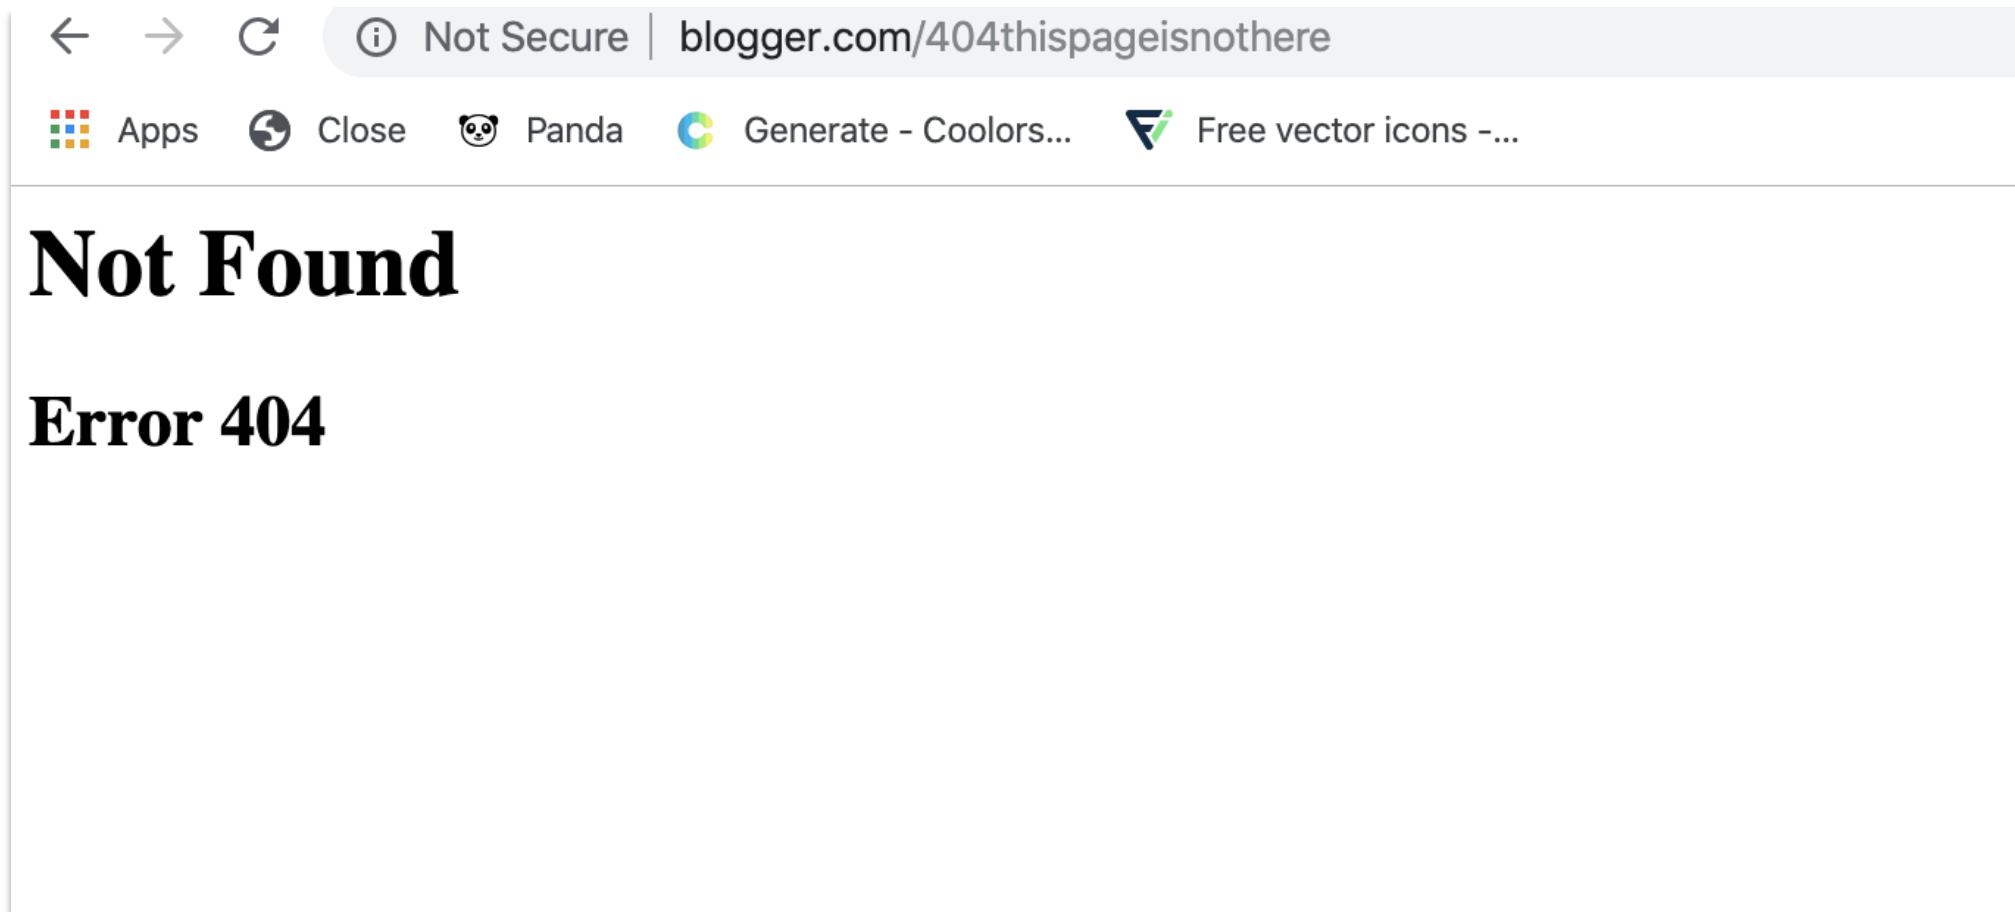

Suggestions

- Key information must be “above the fold”
 - Especially on low-resolution devices
- Keep high signal-to-noise ratio
 - Colors, fonts, backgrounds, animations, ...
 - Borders, dividers, ...
- Minimalistic login experience
- Accept redundant ways of entering information
- Prune features that are outside the “core” functionality

#9: Help users recognize, diagnose, and recover from errors

- Error messages should be expressed in plain language (no codes), precisely indicate the problem, and constructively suggest a solution.

#9: Help users recognize, diagnose, and recover from errors

#9: Help users recognize, diagnose, and recover from errors

Suggestions

- Make errors easy to identify
 - Colors, fonts, ...
- Make problem clear
 - Problem cause
 - Problem location
- Provide a solution
 - Give a suggestion
 - Show a path forward
 - Propose an alternative

#10: Help and documentation

- Even though it is better if the system can be used without documentation, it may be necessary to provide help and documentation. Any such information should be easy to search, focused on the user's task, list concrete steps to be carried out, and not be too large.

#10: Help and documentation

A screenshot of the GoodBerry dashboard. The dashboard features a navigation menu with links like Home, Profile, Products, Commerce, Marketing, Analytics, and Reports. A central area displays a line graph titled 'Revenue 21 Aug to 21 Aug' with data points for '21 Aug' (469), '20 Aug' (5830), and '19 Aug' (11). To the right of the graph is a large play button with the text 'watch the video'. Below the graph, there's a section titled 'What's New' with a list of items such as 'New GoodBerry website', 'GoodBerry now integrates with MailChimp', 'GoodBerry now integrates with ClickBank', etc. On the far right, there are sections for 'Commerce Overview' and 'Marketing Overview'.

#10: Help and documentation

today

Suggestions

- Provide examples
 - In documentation
 - In complex choices
- Help the user understanding the error gravity
 - E.g., printing outside margins
- Provide ‘tips’ for showing new actions or steps
- Use pop-overs to point to changes in UI (or for first usage)
- Avoid too-opaque “terms and conditions” (summarize, if possible)

Example

- Target website: <https://trenitalia.com/>
 - Trenitalia is the primary train operator in Italy
 - It offers national rail transport with regional trains and high-speed trains (“Frecciarossa”)
- Useful tasks to spot several problems:
 - Explore the offers proposed by the website and buy a discounted ticket
 - Buy a “Frecciarossa” round trip from Turin to Rome for the winter holidays
 - Chat with an operator for receiving support
- In performing the tasks, you can register/login to the platform and change the language of the website, if you want

Example - Template

[Issue #]. [Heuristic #] [Heuristic Title]

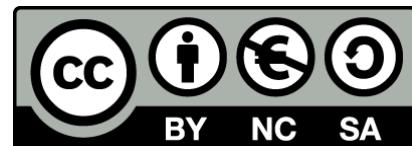

- Where: [Where the issue occurred – task, step, page]
- What: [Description of the problem]
- Why: [Reason why it violates the heuristic]
- Severity: [0-4, according to Nielsen's severity rating]

1. H4 Consistency and standards

- Where: Specify your language.
- What: The app uses “Save” for saving information, except here where it uses “Store”.
- Why: It is an inconsistent terminology for the same function in the application, which can create confusion.
- Severity: 3
